## INTRODUCTION

The OPTOMA (Ocean Prediction Through Observation, Modeling and Analysis) Program, a joint NPS/Harvard program sponsored by ONR, seeks to understand the mesoscale (fronts, eddies, and jets) variability and dynamics of the California Current System (CCS) and to determine the scientific limits to practical mesoscale ocean forecasting. To help carry out the aims of this project, a series of cruises and flights were planned in two subdomains, NOCAL and CENCAL, shown in Figure 1.

Naval Oceanographic Office (NAVOCEANO) Project OS-06-87 was a two week deployment of the BIRDSEYE RP-3D aircraft in support of the OPTOMA program. A total of six flights were flown between 9 and 19 November; five of these were surveys of the OPTOMA domain and one was an acoustical survey of Monterey Bay. During the last two flights, the R/V POINT SUR acquired data in the CENCAL domain.

OPTOMA 23 is the last of the OPTOMA surveys and it is unique in that this was the first effort to integrate concurrent satellite, drifting buoy, ship, and aircraft data in a comprehensive oceanographic, meteorological and acoustical study of the CCS. Specific goals of the airborne surveys were to:

- provide synoptic data for objective analysis of various parameters (e.g., SST from AXBT and PRT-5, mixed layer depth, thermal structure)
- provide initialization, boundary condition updating, and verification fields for dynamical model forecasts
- coordinate the observational strategy of the R/V POINT SUR by using near-real-time analyses to vector the ship into areas of interesting mesoscale activity

The aircraft flew at an altitude of 800 to 1000 feet at a speed of 240 knots. Each survey took about 9 hours to accomplish including 2 hours transit time to and from Monterey airport. Approximately 100 airborne expendable bathythermographs (AXBT) were deployed on each flight over the tracks shown in figures 2,7 12,17 and 22. Station positions were determined by two Litton 72 inertial navigation systems supplemented by LORAN C fixes and are estimated to be accurate to within about 0.1 km. Nominal station spacing was about 40 km along-track.

## DATA ACQUISITION

Data acquired during OPTOMA23 include temperature-depth profiles from Sippican, Hermes, and Magnavox AXBT's, and PRT-5 surface temperatures, with accuracies as given in Table 1. The AXBT data were digitized at 0.1 second intervals

using the NPS Airborne Digital Data Acquisition System with a Sippican MK9 unit and the NAVOCEANO airborne acquisition system. Continuous flight level dewpoint, flight level temperature, PRT-5 sea surface temperature, and PRT-5 upward looking measurements (to detect overcast conditions) were also recorded on strip chart and digitized on 9-track tape. All data were recorded on strip charts, cassette tapes or on 9-track tapes. In this report, the AXBT data are presented.

#### **DATA PROCESSING**

All data were transferred to the IBM 3033 mainframe computer for editing and processing. The digitized AXBT data were edited with a spike removal routine and smoothed. Since the AXBT's used were from three different manufacturers, the standard Navy equation was used to convert AXBT time of fall to depth.

AXBT failure rate for various reasons was high, about 20%. Of the remaining records, approximately 96% were retained in the data set. The data have been transferred on digital tape to the National Oceanographic Data Center in Washington, DC.

#### **DATA PRESENTATION**

The flight tracks, station locations, and station numbers are shown for each of the five OPTOMA legs in figures 3,8,13,18, and 23. On the flight track figures, transect extremes are identified by letter to aid in cross-referencing the data presented in subsequent figures. These figures are followed by a listing of the stations with their coordinates, the date and time when each station was occupied, and the surface information obtained at the station.

Vertical profiles of temperature from the AXBT casts are shown in staggered fashion. The first profile on each plot is shown with its temperature unchanged; to each subsequent profile, an appropriate multiple of 5 C has been added. The location of these profiles may be found by reference to the various maps of the cruise tracks. Transect extremes are identified as nearly as possible.

Vertical transects of the temperature field are shown on the next pages. The tick marks identify station positions and, again, the transect extremes are shown on these plots.

Mean profiles of temperature and the standard deviation envelope from the AXBT's for each flight are given in figures 6,11,16,21, and 26.

Table 1: Scientific instruments aboard the RP-3D BIRDSEYE aircraft

Instrument	Variable	Range	Operational Accuracy
Hygrometer Cambridge System Model 137-00-53	Dew Point	$\pm 50 \text{ }^\circ\text{C}$	$1.0 \text{ }^\circ\text{C}$
Rosemont Temperature Probe 102E4AL	Air Temp	$-60 \text{ }^\circ\text{C}$ to $+40 \text{ }^\circ\text{C}$	5%
Sippican Magnavox Hermes AXBT	Temperature to 300 or 800 m	$-2$ to $+35 \text{ }^\circ\text{C}$	$0.2 \text{ }^\circ\text{C}$
	Depth		5% depth
Litton 72 Inertial Navigation	Position	N/A	2 km
Airborne Radiation Thermometer (PRT-5)	Surface Temp	$-0.2$ to $+35 \text{ }^\circ\text{C}$	$\pm 0.4 \text{ }^\circ\text{C}$

## ACKNOWLEDGEMENTS

This research was sponsored by the ONR Physical Oceanography Program. The members of crew one of Ocean Development Squadron Eight (VXN-8) headed by LCDR Ron Repper were most capable, very flexible and thoroughly professional in carrying out the missions assigned by the scientific party. The members of the scientific party were:

LCDR J. Edward Johnson, Chief Scientist, NPS  
Ms. Melissa Ciandro, Party Chief, NPS  
Mr. Jeff Kerling, NAVOCEANO  
Mr. Gary Athey, NAVOCEANO  
Dr. Janet Boyd, NORDA

Thanks also to Ms. Arlene Bird for her help in editing this report and processing it through the final stages.
